## 08 Multidimensional Arrays

#### Motivations

Thus far, you have used one-dimensional arrays to model linear collections of elements. You can use a two-dimensional array to represent a matrix or a table. For example, the following table that describes the distances between the cities can be represented using a two-dimensional array.

#### Distance Table (in miles)

|          | Chicago | Boston | New York | Atlanta | Miami | Dallas | Houston |
|----------|---------|--------|----------|---------|-------|--------|---------|
| Chicago  | 0       | 983    | 787      | 714     | 1375  | 967    | 1087    |
| Boston   | 983     | 0      | 214      | 1102    | 1763  | 1723   | 1842    |
| New York | 787     | 214    | 0        | 888     | 1549  | 1548   | 1627    |
| Atlanta  | 714     | 1102   | 888      | 0       | 661   | 781    | 810     |
| Miami    | 1375    | 1763   | 1549     | 661     | 0     | 1426   | 1187    |
| Dallas   | 967     | 1723   | 1548     | 781     | 1426  | 0      | 239     |
| Houston  | 1087    | 1842   | 1627     | 810     | 1187  | 239    | 0       |

#### **Motivations**

```
double[][] distances = {
    {0, 983, 787, 714, 1375, 967, 1087},
    {983, 0, 214, 1102, 1763, 1723, 1842},
    {787, 214, 0, 888, 1549, 1548, 1627},
    {714, 1102, 888, 0, 661, 781, 810},
    {1375, 1763, 1549, 661, 0, 1426, 1187},
    {967, 1723, 1548, 781, 1426, 0, 239},
    {1087, 1842, 1627, 810, 1187, 239, 0},
};
```

## Objectives

- $\Box$  To give examples of representing data using two-dimensional arrays (§8.1).
- □ To declare variables for two-dimensional arrays, create arrays, and access array elements in a two-dimensional array using row and column indexes (§8.2).
- □ To program common operations for two-dimensional arrays (displaying arrays, summing all elements, finding the minimum and maximum elements, and random shuffling) (§8.3).
- $\square$  To pass two-dimensional arrays to methods (§8.4).
- □ To write a program for grading multiple-choice questions using two-dimensional arrays (§8.5).
- □ To solve the closest-pair problem using two-dimensional arrays (§8.6)
- □ To check a Sudoku solution using two-dimensional arrays (§8.7).
- $\Box$  To use multidimensional arrays (§8.8).

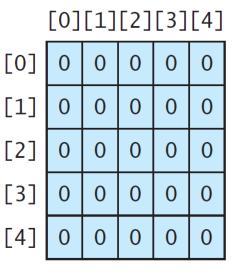

#### Declare/Create Two-dimensional Arrays

```
// Declare array ref var
dataType[][] refVar;
// Create array and assign its reference to variable
refVar = new dataType[10][10];
// Combine declaration and creation in one statement
dataType[][] refVar = new dataType[10][10];
// Alternative syntax
dataType refVar[][] = new dataType[10][10];
```

# Declaring Variables of Twodimensional Arrays and Creating Two-dimensional Arrays

```
int[][] matrix = new int[10][10];
 or
int matrix[][] = new int[10][10];
matrix[0][0] = 3;
for (int i = 0; i < matrix.length; i++)</pre>
  for (int j = 0; j < matrix[i].length; j++)</pre>
    matrix[i][j] = (int) (Math.random() * 1000)
double[][] x;
```

### Two-dimensional Array Illustration

```
matrix = new int[5][5];
```

(a)

matrix.length? 5

matrix[0].length? 5

```
[0][1][2][3][4]
[0]
[1]
         0
            0
                0
[2]
            0
                0
[3]
         0
            0
                0
[4]
         0
            0
```

```
matrix[2][1] = 7;
```

(b)

```
[0][1][2]
[0] 1 2 3
[1] 4 5 6
[2] 7 8 9
[3] 10 11 12
```

```
int[][] array = {
    {1, 2, 3},
    {4, 5, 6},
    {7, 8, 9},
    {10, 11, 12}
};
```

(c)

array.length? 4

array[0].length? 3

# Declaring, Creating, and Initializing Using Shorthand Notations

You can also use an array initializer to declare, create and initialize a two-dimensional array. For example,

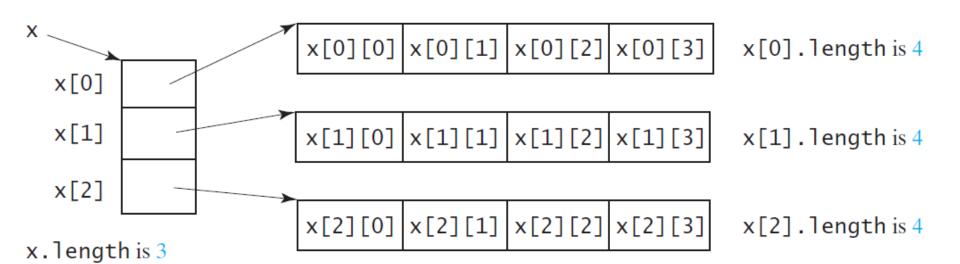

```
int[][] array = {
    {1, 2, 3},
    {4, 5, 6},
    {7, 8, 9},
    {10, 11, 12}
};
```

Same as

```
int[][] array = new int[4][3];
array[0][0] = 1; array[0][1] = 2; array[0][2] = 3;
array[1][0] = 4; array[1][1] = 5; array[1][2] = 6;
array[2][0] = 7; array[2][1] = 8; array[2][2] = 9;
array[3][0] = 10; array[3][1] = 11; array[3][2] = 12;
```

# Lengths of Two-dimensional Arrays

int[][] x = new int[3][4];

# Lengths of Two-dimensional Arrays, cont.

array[4].length ArrayIndexOutOfBoundsException

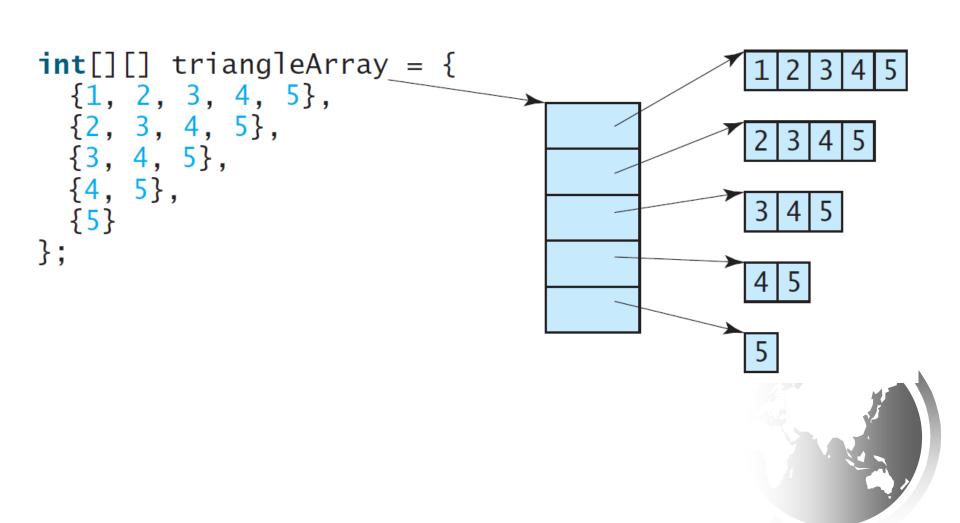

# Ragged Arrays

Each row in a two-dimensional array is itself an array. So, the rows can have different lengths. Such an array is known as *a ragged array*. For example,

```
int[][] matrix = {
    {1, 2, 3, 4, 5},
    {2, 3, 4, 5},
    {3, 4, 5},
    {4, 5},
    {5}
```

matrix.length is 5 matrix[0].length is 5 matrix[1].length is 4 matrix[2].length is 3 matrix[3].length is 2 matrix[4].length is 1

#### Ragged Arrays, cont.

#### 2-10 以下二维数组的定义正确的是() (2分)

- $\bigcirc$  A. int a[3][2]={{1,2},{1,3},{2,3}}
- B. int a[][]=new int[3][]
- C. int[][] a=new int[][3]
- D. int[][] a=new int[][]

### Processing Two-Dimensional Arrays

See the examples in the text.

- 1. (Initializing arrays with input values)
- 2. (Printing arrays)
- 3. (Summing all elements)
- 4. (Summing all elements by column)
- 5. (Which row has the largest sum)
- 6. (Finding the smallest index of the largest element)
- 7. (Random shuffling)

# Initializing arrays with input values

```
java.util.Scanner input = new Scanner(System.in);
System.out.println("Enter " + matrix.length + " rows and " +
    matrix[0].length + " columns: ");
for (int row = 0; row < matrix.length; row++) {
    for (int column = 0; column < matrix[row].length; column++) {
        matrix[row][column] = input.nextInt();
    }
}</pre>
```

#### Initializing arrays with random values

```
for (int row = 0; row < matrix.length; row++) {
  for (int column = 0; column < matrix[row].length; column++) {
    matrix[row][column] = (int)(Math.random() * 100);
  }
}</pre>
```

## Printing arrays

```
for (int row = 0; row < matrix.length; row++) {
  for (int column = 0; column < matrix[row].length; column++) {
    System.out.print(matrix[row][column] + " ");
  }
  System.out.println();
}</pre>
```

# Summing all elements

```
int total = 0;
for (int row = 0; row < matrix.length; row++) {
  for (int column = 0; column < matrix[row].length; column++) {
    total += matrix[row][column];
  }
}</pre>
```

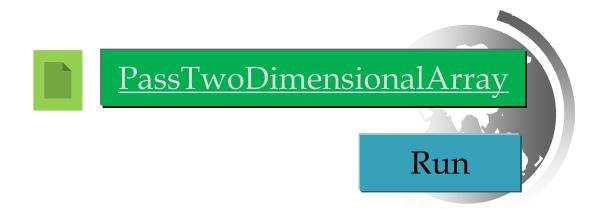

# Summing elements by column

### Random shuffling

```
for (int i = 0; i < matrix.length; i++) {
 for (int j = 0; j < matrix[i].length; j++) {
  int i1 = (int)(Math.random() * matrix.length);
  int j1 = (int)(Math.random() * matrix[i].length);
  // Swap matrix[i][j] with matrix[i1][j1]
  int temp = matrix[i][j];
  matrix[i][j] = matrix[i1][j1];
  matrix[i1][j1] = temp;
```

# Passing Tow-Dimensional Arrays to Methods

# Problem: Grading Multiple-Choice Test

#### Students' answer

```
0 1 2 3 4 5 6 7 8 9
Student 0
          ABACCDEEAD
Student 1
            BABCAFFAD
Student 2

### Multidimensional Arrays

Occasionally, you will need to represent n-dimensional data structures. In Java, you can create n-dimensional arrays for any integer n.

The way to declare two-dimensional array variables and create two-dimensional arrays can be generalized to declare n-dimensional array variables and create n-dimensional arrays for n >= 3.

### Multidimensional Arrays

#### Problem: Calculating Total Scores

Objective: write a program that calculates the total score for students in a class. Suppose the scores are stored in a three-dimensional array named <u>scores</u>. The first index in <u>scores</u> refers to a student, the second refers to an exam, and the third refers to the part of the exam. Suppose there are 7 students, 5 exams, and each exam has two parts—the multiple-choice part and the programming part. So, <u>scores[i][j][0]</u> represents the score on the multiple-choice part for the <u>i</u>'s student on the <u>j</u>'s exam. Your program displays the total score for each student.

Run

#### Problem: Weather Information

Suppose a meteorology station records the temperature and humidity at each hour of every day and stores the data for the past ten days in a text file named weather.txt. Each line of the file consists of four numbers that indicate the day, hour, temperature, and humidity. Your task is to write a program that calculates the average daily temperature and humidity for the <u>10</u> days.

```
1 1 76.4 0.92
1 2 77.7 0.93
...
10 23 97.7 0.71
10 24 98.7 0.74
```

```
10 24 98.7 0.74
1 2 77.7 0.93
...
10 23 97.7 0.71
1 1 76.4 0.92
```

#### Problem: Guessing Birthday

Listing 4.3, GuessBirthday.java, gives a program that guesses a birthday. The program can be simplified by storing the numbers in five sets in a three-dimensional array, and it prompts the user for the answers using a loop.
