15 Recursion

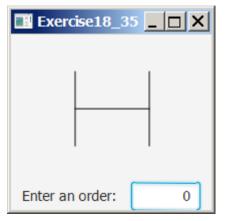

Motivations

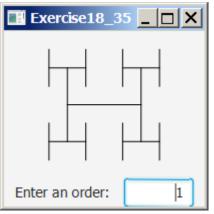

Suppose you want to find all the files under a directory that contains a particular word. How do you solve this problem? There are several ways to solve this problem. An intuitive solution is to use recursion by searching the files in the subdirectories recursively.

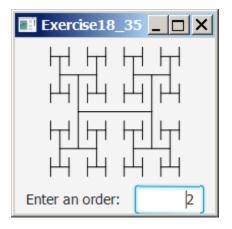

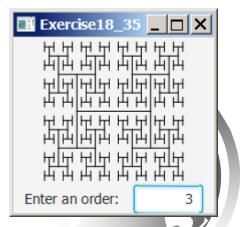

Motivations

H-trees, depicted in Figure 18.1, are used in a very large-scale integration (VLSI) design as a clock distribution network for routing timing signals to all parts of a chip with equal propagation delays. How do you write a program to display H-trees? A good approach is to use recursion.

Objectives

- □ To describe what a recursive method is and the benefits of using recursion (§18.1).
- □ To develop recursive methods for recursive mathematical functions (§§18.2–18.3).
- \Box To explain how recursive method calls are handled in a call stack (§§18.2–18.3).
- \Box To solve problems using recursion (§18.4).
- □ To use an overloaded helper method to derive a recursive method (§18.5).
- \Box To implement a selection sort using recursion (§18.5.1).
- □ To implement a binary search using recursion (§18.5.2).
- \Box To get the directory size using recursion (§18.6).
- □ To solve the Tower of Hanoi problem using recursion (§18.7).
- □ To draw fractals using recursion (§18.8).
- □ To discover the relationship and difference between recursion and iteration (§18.9).
- \Box To know tail-recursive methods and why they are desirable (§18.10).

$$n! = n * (n-1)!$$

```
factorial(0) = 1;
```

Characteristics of Recursion

All recursive methods have the following characteristics:

- One or more base cases (the simplest case) are used to stop recursion.
- Every recursive call reduces the original problem, bringing it increasingly closer to a base case until it becomes that case.

In general, to solve a problem using recursion, you break it into subproblems. If a subproblem resembles the original problem, you can apply the same approach to solve the subproblem recursively. This subproblem is almost the same as the original problem in nature with a smaller size.

Problem Solving Using Recursion

Let us consider a simple problem of printing a message for n times. You can break the problem into two subproblems: one is to print the message one time and the other is to print the message for n-1 times. The second problem is the same as the original problem with a smaller size. The base case for the problem is n==0. You can solve this problem using recursion as follows:

```
nPrintln("Welcome", 5);
```

```
public static void nPrintln(String message, int times) {
  if (times >= 1) {
    System.out.println(message);
    nPrintln(message, times - 1);
  } // The base case is times == 0
}
```

Think Recursively

Many of the problems presented in the early chapters can be solved using recursion if you *think recursively*. For example, the palindrome problem can be solved recursively as follows:

```
public static boolean isPalindrome(String s) {
  if (s.length() <= 1) // Base case
    return true;
  else if (s.charAt(0) != s.charAt(s.length() - 1)) // Base case
    return false;
  else
    return isPalindrome(s.substring(1, s.length() - 1));
}</pre>
```

Recursive Helper Methods

The preceding recursive is Palindrome method is not efficient, because it creates a new string for every recursive call. To avoid creating new strings, use a helper method:

```
public static boolean isPalindrome(String s) {
 return isPalindrome(s, 0, s.length() - 1);
public static boolean isPalindrome(String s, int low, int high) {
 if (high <= low) // Base case
  return true;
 else if (s.charAt(low) != s.charAt(high)) // Base case
  return false;
 else
  return isPalindrome(s, low + 1, high - 1);
```

return isPalindrome(s.substring(1, s.length() - 1));

Recursive Selection Sort

- 1. Find the smallest number in the list and swaps it with the first number.
- 2. Ignore the first number and sort the remaining smaller list recursively.

RecursiveSelectionSort

```
public class RecursiveSelectionSort {
  public static void sort(double[] list) {
    sort(list, 0, list.length - 1); // Sort the entire list
  private static void sort(double[] list, int low, int high) {
    if (low < high) {</pre>
      // Find the smallest number and its index in list(low .. high)
      int indexOfMin = low;
      double min = list[low];
      for (int i = low + 1; i <= high; i++) {
        if (list[i] < min) {
          min = list[i];
          indexOfMin = i;
      // Swap the smallest in list(low .. high) with list(low)
      list[indexOfMin] = list[low];
      list[low] = min;
      // Sort the remaining list(low+1 .. high)
      sort(list, low + 1, high);
  public static void main(String[] args) {
    double[] list = \{2, 1, 3, 1, 2, 5, 2, -1, 0\};
    sort(list);
    for (int i = 0; i < list.length; i++)</pre>
      System.out.print(list[i] + " ");
```

Recursive Binary Search

- 1. Case 1: If the key is less than the middle element, recursively search the key in the first half of the array.
- 2. Case 2: If the key is equal to the middle element, the search ends with a match.
- 3. Case 3: If the key is greater than the middle element, recursively search the key in the second half of the array.

RecursiveBinarySearch

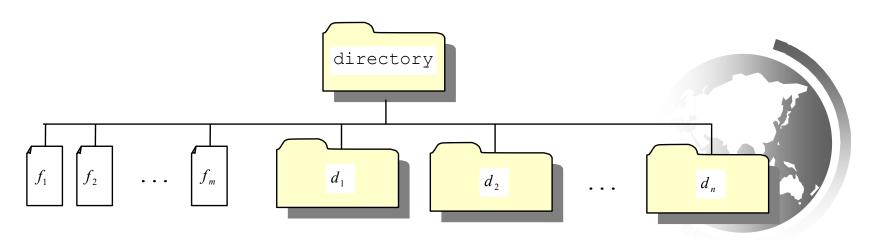

Recursive Implementation

```
/** Use binary search to find the key in the list */
public static int recursiveBinarySearch(int[] list, int key) {
  int low = 0;
  int high = list.length - 1;
  return recursiveBinarySearch(list, key, low, high);
/** Use binary search to find the key in the list between
    list[low] list[high] */
public static int recursiveBinarySearch(int[] list, int key,
  int low, int high) {
  if (low > high) // The list has been exhausted without a match
    return -low - 1;
  int mid = (low + high) / 2;
  if (key < list[mid])</pre>
    return recursiveBinarySearch(list, key, low, mid - 1);
  else if (key == list[mid])
    return mid;
  else
    return recursiveBinarySearch(list, key, mid + 1, high);
```

Directory Size

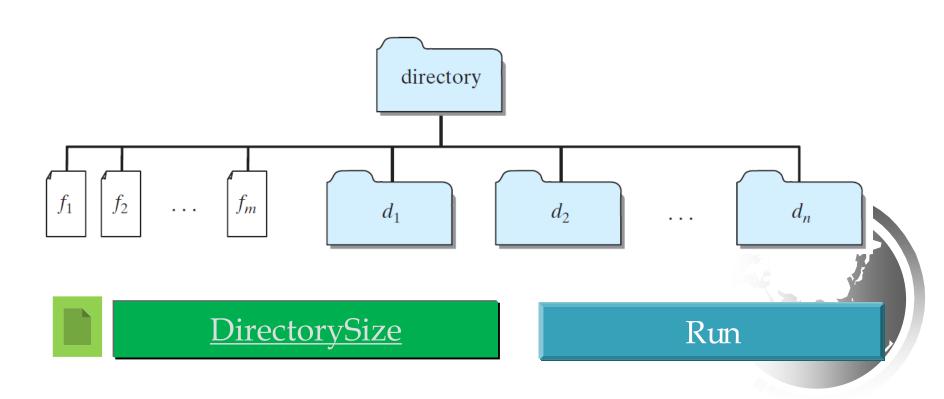

The preceding examples can easily be solved without using recursion. This section presents a problem that is difficult to solve without using recursion. The problem is to find the size of a directory. The size of a directory is the sum of the sizes of all files in the directory. A directory may contain subdirectories. Suppose a directory contains files , , ..., , and subdirectories , , ..., , as shown below.

Directory Size

The size of the directory can be defined recursively as follows:

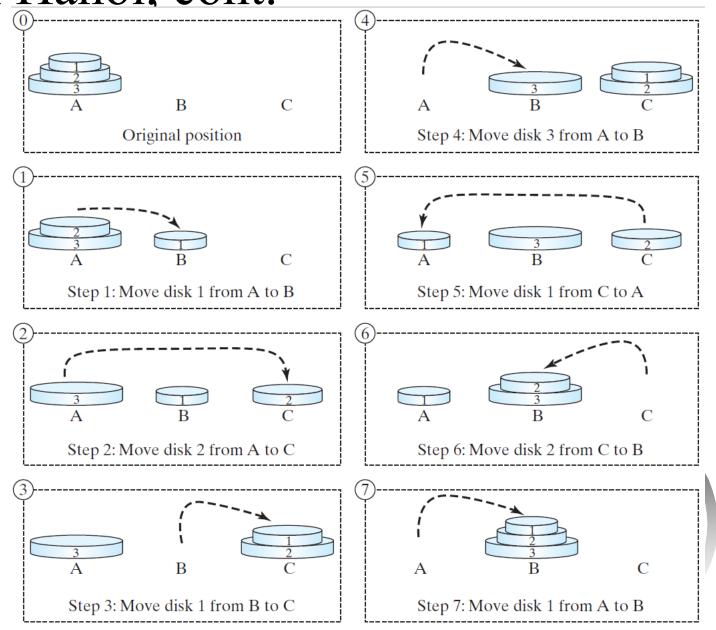

$$size(d) = size(f_1) + size(f_2) + \dots + size(f_m) + size(d_1) + size(d_2) + \dots + size(d_n)$$

Tower of Hanoi

- There are *n* disks labeled 1, 2, 3, . . . , *n*, and three towers labeled A, B, and C.
- No disk can be on top of a smaller disk at any time.
- All the disks are initially placed on tower A.
- Only one disk can be moved at a time, and it must be the top disk on the tower.

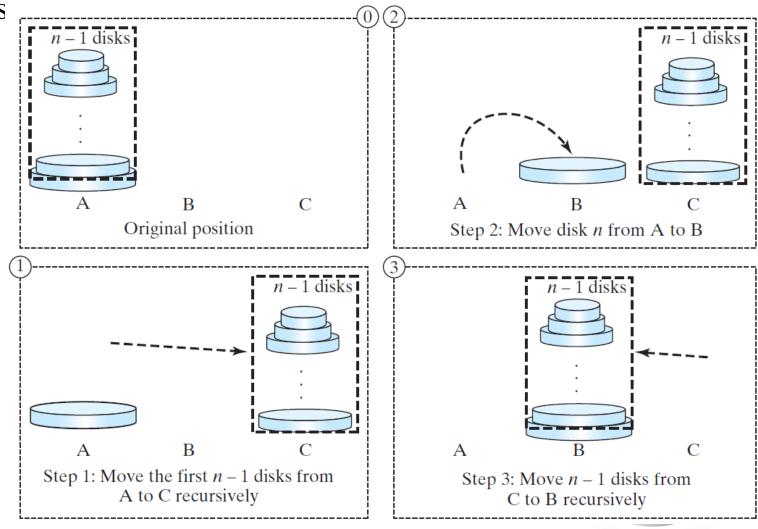

Tower of Hanoi, cont.

Solution to Tower of Hanoi

The Tower of Hanoi problem can be decomposed into three

subproblems

Solution to Tower of Hanoi

- \square Move the first $\underline{n-1}$ disks from A to C with the assistance of tower B.
- \square Move disk \underline{n} from A to B.
- \square Move <u>n 1</u> disks from C to B with the assistance of tower A.

TowerOfHanoi

Run

```
public class TowersOfHanoi {
  /** Main method */
 public static void main(String[] args) {
    // Create a Scanner
    Scanner input = new Scanner(System.in);
    System.out.print("Enter number of disks: ");
    int n = input.nextInt();
    // Find the solution recursively
    System.out.println("The moves are:");
   moveDisks(n, 'A', 'B', 'C');
  /** The method for finding the solution to move n disks
      from fromTower to toTower with auxTower */
  public static void moveDisks(int n, char fromTower,
      char toTower, char auxTower) {
    if (n == 1) // Stopping condition
      System.out.println("Move disk " + n + " from " +
        fromTower + " to " + toTower);
    else {
      moveDisks(n - 1, fromTower, auxTower, toTower);
      System.out.println("Move disk " + n + " from " +
        fromTower + " to " + toTower);
     moveDisks(n - 1, auxTower, toTower, fromTower);
```

Exercise 18.3 GCD

```
gcd(2, 3) = 1

gcd(2, 10) = 2

gcd(25, 35) = 5

gcd(205, 301) = 5

gcd(m, n)
```

Approach 1: Brute-force, start from min(n, m) down to 1, to check if a number is common divisor for both m and n, if so, it is the greatest common divisor.

Approach 2: Euclid's algorithm

Approach 3: Recursive method

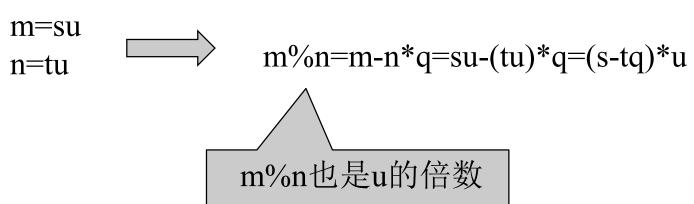

Approach 2: Euclid's algorithm

```
// Get absolute value of m and n;
t1 = Math.abs(m); t2 = Math.abs(n);
// r is the remainder of t1 divided by t2;
r = t1 % t2;
while (r != 0) {
  t1 = t2;
  t2 = r;
  r = t1 % t2;
// When r is 0, t2 is the greatest common
// divisor between t1 and t2
return t2;
```

Approach 3: Recursive Method

$$gcd(m, n) = n \text{ if } m \% n = 0;$$

 $gcd(m, n) = gcd(n, m \% n); \text{ otherwise};$

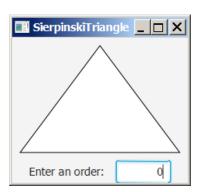

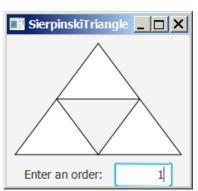

Fractals?

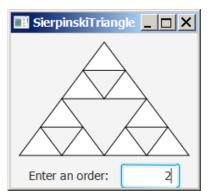

A fractal is a geometrical figure just like triangles, circles, and rectangles, but fractals can be divided into parts, each of which is a reduced-size copy of the whole. There are many interesting examples of fractals. This section introduces a simple fractal, called Sierpinski triangle, named after a famous Polish mathematician.

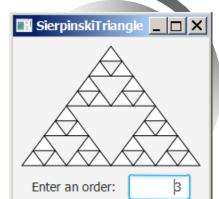

Sierpinski Triangle

- 1. It begins with an equilateral triangle, which is considered to be the Sierpinski fractal of order (or level) 0, as shown in Figure (a).
- 2. Connect the midpoints of the sides of the triangle of order 0 to create a Sierpinski triangle of order 1, as shown in Figure (b).
- Leave the center triangle intact. Connect the midpoints of the sides of the three other triangles to create a Sierpinski of order 2, as shown in Figure (c).
- 4. You can repeat the same process recursively to create a Sierpinski triangle of order 3, 4, ..., and so on, as shown in Figure (d).

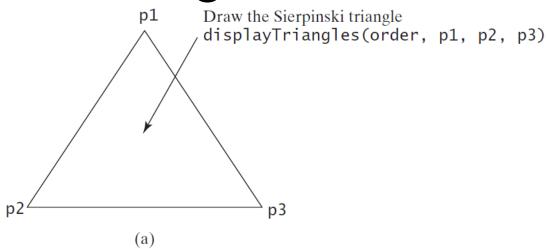

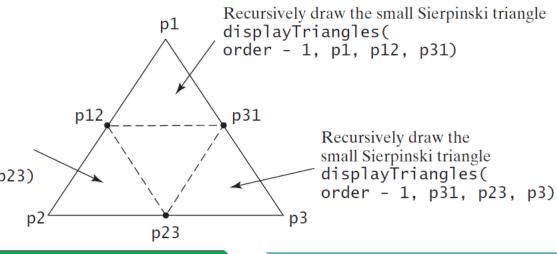

Sierpinski Triangle Solution

Recursively draw the small Sierpinski triangle displayTriangles(order - 1, p12, p2, p23)

SierpinskiTriangle

Run

Recursion vs. Iteration

Recursion is an alternative form of program control. It is essentially repetition without a loop.

Recursion bears substantial overhead. Each time the program calls a method, the system must assign space for all of the method's local variables and parameters. This can consume considerable memory and requires extra time to manage the additional space.

Advantages of Using Recursion

Recursion is good for solving the problems that are inherently recursive.

Tail Recursion

A recursive method is said to be *tail recursive* if there are no pending operations to be performed on return from a recursive call.

Non-tail recursive

ComputeFactorial

Tail recursive

ComputeFactorialTailRecursion

当最后一个递归调用结束后,方法也结束了。无须将中间的调用存储在栈中,编译器会优化尾递归来减少栈空间。

用辅助参数将非尾递归转为尾递归

```
/** Return the factorial for a specified num
                                       普通递归,这里当
public static long factorial(int n) {
 if (n == 0) // Base case
                                       factorial(n-1)返回后还有操作
   return 1;
                                       (*)
 else
   return n * factorial(n - 1); // Recursive call
public class ComputeFactorialTailRecursion {
   /** Return the factorial for a specified number */
  public static long factorial(int n) {
    return factorial(n, 1); // Call auxiliary method
   /** Auxiliary tail-recursive method for factorial */
   private static long factorial(int n, int result) {
    if (n == 0)
       return result;
    else
      return factorial(n - 1, n * result); // Recursive call
                                        尾递归,直接返回上一个递
                                        归函数结果
```
